

16. Given is the reaction  $e^+ + e^- \rightarrow \mu^+ + \mu^-$ . This reaction can be mediated via the electromagnetic and the weak force carrier  $\gamma$  and  $Z^0$ .

First calculate  $\frac{d\sigma}{d\cos\theta}$ , where  $\cos\theta$  is the angle between incoming  $e^-$  and outgoing  $\mu^-$  in the CMS. The masses of electron and muon are neglected and the corresponding Feynman rules can be found in the lecture notes.

Then calculate the function

$$A_{FB} = \frac{\int_0^1 \frac{d\sigma}{d\cos\theta} d\cos\theta - \int_{-1}^0 \frac{d\sigma}{d\cos\theta} d\cos\theta}{\int_0^1 \frac{d\sigma}{d\cos\theta} d\cos\theta + \int_{-1}^0 \frac{d\sigma}{d\cos\theta} d\cos\theta}. \quad (46)$$

$A_{FB}$  is the abbreviation for "Asymmetry-Forward-Backwards". Verify that

$$A_{FB}(\sqrt{s} = m_Z) = 3(1 - 4\sin^2\theta_W)^2. \quad (47)$$

This measurement leads to a very accurate determination of the Weinberg angle. In order to be able to evaluate  $A_{FB}$  also directly at the  $Z$ -pole, (47), we include the finite

$Z$ -width  $\Gamma_Z(\leq m_Z)$  in the denominator of the  $Z$ -propagator,  $s - m_Z^2 \rightarrow s - m_Z^2 + i m_Z \Gamma_Z$ .
