

6. Tutorium - Lösungen

25.11.2011

6.1 Gaußsches Integral

a) Jacobi-Matrix:

$$\left| \frac{\partial(x,y)}{\partial(r,\varphi)} \right| = \begin{pmatrix} \frac{\partial x}{\partial r} \Big|_{\varphi} & \frac{\partial x}{\partial \varphi} \Big|_r \\ \frac{\partial y}{\partial r} \Big|_{\varphi} & \frac{\partial y}{\partial \varphi} \Big|_r \end{pmatrix} = \begin{pmatrix} \cos \varphi & -r \sin \varphi \\ \sin \varphi & r \cos \varphi \end{pmatrix}.$$

$$\begin{aligned} dx dy &= \left| \frac{\partial(x,y)}{\partial(r,\varphi)} \right| dr d\varphi \\ &= \left| \begin{array}{cc} \frac{\partial x}{\partial r} \Big|_{\varphi} & \frac{\partial x}{\partial \varphi} \Big|_r \\ \frac{\partial y}{\partial r} \Big|_{\varphi} & \frac{\partial y}{\partial \varphi} \Big|_r \end{array} \right| dr d\varphi \\ &= \begin{vmatrix} \cos \varphi & -r \sin \varphi \\ \sin \varphi & r \cos \varphi \end{vmatrix} dr d\varphi \\ &= (r \cos^2 \varphi + r \sin^2 \varphi) dr d\varphi \\ &= r dr d\varphi, \end{aligned}$$

Jacobi-Determinante:

$$\left| \frac{\partial(x,y)}{\partial(r,\varphi)} \right| = \det \frac{\partial(x,y)}{\partial(r,\varphi)} = \begin{vmatrix} \cos \varphi & -r \sin \varphi \\ \sin \varphi & r \cos \varphi \end{vmatrix} = r \cos^2 \varphi + r \sin^2 \varphi = r.$$

b) Gaußsches Integral:

$$\begin{aligned} \left(\int_{-\infty}^{\infty} e^{-u^2} du \right)^2 &= \int_{-\infty}^{\infty} e^{-x^2} dx \int_{-\infty}^{\infty} e^{-y^2} dy \\ &= \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-(x^2+y^2)} dx dy \\ &= \int_0^{2\pi} d\varphi \int_0^{\infty} dr r e^{-r^2} \\ &= 2\pi \int_0^{\infty} \frac{ds}{2r} r e^{-s} = \pi \int_0^{\infty} ds e^{-s} = \\ &= \pi (-e^{-\infty} + e^{-0}) = \pi (0 + 1) = \pi \end{aligned}$$

wobei die Transformation des Flächenelements über die Jacobi-Determinante $dx d\varphi = \left| \frac{\partial(x,y)}{\partial(r,\varphi)} \right| dr d\varphi = r dr d\varphi = r dr d\varphi$ und die Substitution $r^2 = s$, $2r dr = ds$ verwendet wurden.

6.2 Residuensatz

a) Lösungen von $x^n + 1 = 0$, also $x^n = -1$: Satz von de Moivre: $e^{in\varphi} = (e^{i\varphi})^n = \cos(n\varphi) + i \sin(n\varphi)$. Rechte Seite ergibt -1 für $n\varphi = \pi(2N+1)$ mit ganzzahligem N . Daher $\varphi = \frac{\pi}{n}(2N+1)$ mit $N = 0, 1, \dots, n-1$.

Für $x = 4$ hat man $x_1 = e^{\frac{i\pi}{4}} = \frac{1+i}{\sqrt{2}}$, $x_2 = e^{\frac{3i\pi}{4}} = \frac{-1+i}{\sqrt{2}}$, $x_3 = e^{\frac{5i\pi}{4}} = e^{-\frac{3i\pi}{4}} = \frac{-1-i}{\sqrt{2}}$, $x_4 = e^{\frac{7i\pi}{4}} = e^{-\frac{i\pi}{4}} = \frac{1-i}{\sqrt{2}}$.

b) Da $h(x)$ eine einfache Nullstelle bei $x = c$ hat, gilt $h(x) \approx (x - c)h'(c)$ in einer Umgebung von $x = c$. Daher:

$$\begin{aligned} \text{Res}_{x \rightarrow c} f(x) &= \text{Res}_{x \rightarrow c} f(x) = \text{Res}_{x \rightarrow c} \frac{g(x)}{h(x)} \approx \text{Res}_{x \rightarrow c} \frac{g(x)}{(x-c)h'(c)} = \lim_{x \rightarrow c} (x - c) \frac{g(x)}{(x-c)h'(c)} \\ &= \lim_{x \rightarrow c} \frac{g(x)}{h'(c)} = \frac{g(c)}{h'(c)}. \end{aligned}$$

Wem das „ \approx “ zu ungenau ist, der kann $h(x)$ auch in einer Taylor-Reihe $h(x) = 0 + (x - c) h'(c) + \frac{1}{2!} (x - c)^2 h''(c) + \dots$ expandieren und dann die Laurentreihe des Quotienten bilden. Der Koeffizient $a_{-1} = g(c)/h'(c)$ der Laurentreihe $f(x) = \sum_{n=-\infty}^{\infty} a_n (x - c)^n$ ist dann genau das gesuchte Residuum.

c) Die Pole befinden sich bei $e^{\pm i\pi/4}$ und $e^{\pm 3i\pi/4}$. Man kann die oberen zwei Pole wählen, und den Integrationsweg über den oberen Halbkreis schließen, der keinen Beitrag liefert. Die Residuen an den Polen der oberen Halbebene sind

$$\text{Res}_{x \rightarrow e^{i\pi/4}} \frac{x^2 + ax + b}{x^4 + 1} = \frac{x^2 + ax + b}{4x^3} \Big|_{x=e^{i\pi/4}} = \frac{i+ae^{i\pi/4}+b}{4e^{3i\pi/4}}.$$

$$\text{Res}_{x \rightarrow e^{3i\pi/4}} \frac{x^2 + ax + b}{x^4 + 1} = \frac{x^2 + ax + b}{4x^3} \Big|_{x=e^{3i\pi/4}} = \frac{-i+ae^{3i\pi/4}+b}{4e^{9i\pi/4}} = \frac{-i+ae^{3i\pi/4}+b}{4e^{i\pi/4}}.$$

Schließen im oberen Halbkreis (positiver Umlaufsinn, daher kein zusätzliches „-“) ergibt:

$$\int_{-\infty}^{\infty} \frac{x^2 + bx + c}{x^4 + 1} dx = 2\pi i \left(\text{Res}_{x \rightarrow e^{i\pi/4}} \frac{x^2 + ax + b}{x^4 + 1} + \text{Res}_{x \rightarrow e^{3i\pi/4}} \frac{x^2 + ax + b}{x^4 + 1} \right)$$

$$= 2\pi i \left(\frac{i+ae^{i\pi/4}+b}{4} e^{-3i\pi/4} + \frac{-i+ae^{3i\pi/4}+b}{4} e^{-i\pi/4} \right)$$

$$= \frac{\pi i}{2} \left[i \left(\frac{-1-i}{\sqrt{2}} - \frac{1-i}{\sqrt{2}} \right) + a(-i+i) + b \left(\frac{-1-i}{\sqrt{2}} + \frac{1-i}{\sqrt{2}} \right) \right] = \frac{\pi}{\sqrt{2}} (1+b).$$

6.3 Testfunktionen

$$a) F(\varphi) = \int_{-\infty}^{\infty} \delta(ax + b)\varphi(x)dx = \int_{-\infty}^{\infty} \delta(y)\varphi\left(\frac{y-b}{a}\right) \frac{1}{a} dy = \frac{1}{a} \varphi\left(-\frac{b}{a}\right).$$

Variablensubstitution $ax + b = y$, $a dx = dy$, $dx = \frac{1}{a} dy$. Integrationsgrenzen bleiben für $a > 0$ gleich: $-\infty$ bis $+\infty$.

Testfunktion φ : Im Allgemeinen muss eine Testfunktion einen kompakten Träger haben (daher insbesondere im Unendlichen verschwinden) und beliebig oft differenzierbar sein.

b) Für $a < 0$ ändern sich Integrationsgrenzen:

$$F(\varphi) = \int_{-\infty}^{\infty} \delta(ax + b)\varphi(x)dx = \int_{+\infty}^{-\infty} \delta(y)\varphi\left(\frac{y-b}{a}\right) \frac{1}{a} dy = - \int_{-\infty}^{+\infty} \delta(y)\varphi\left(\frac{y-b}{a}\right) \frac{1}{a} dy = -\frac{1}{a} \varphi\left(-\frac{b}{a}\right).$$

6.4 Parabolische Koordinaten

a) $g'_{ij} = \frac{\partial x^i}{\partial x^n} \frac{\partial x_j}{\partial x^n}$. Mit $x'^1 = x$, $x'^2 = u$, und $x'^3 = v$ ergibt sich

$$g'_{11} = \frac{\partial x^1}{\partial x'^1} \frac{\partial x_1}{\partial x'^1} = \frac{\partial x}{\partial x} \frac{\partial x}{\partial x} + \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial x} \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial x} + \frac{\partial(uv)}{\partial x} \frac{\partial(uv)}{\partial x} = 1 + 0 + 0 = 1.$$

$$g'_{22} = \frac{\partial x^1}{\partial x'^2} \frac{\partial x_1}{\partial x'^2} = \frac{\partial x}{\partial u} \frac{\partial x}{\partial u} + \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial u} \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial u} + \frac{\partial(uv)}{\partial u} \frac{\partial(uv)}{\partial u} = 0 + u^2 + v^2 = u^2 + v^2.$$

$$g'_{33} = \frac{\partial x^1}{\partial x'^3} \frac{\partial x_1}{\partial x'^3} = \frac{\partial x}{\partial v} \frac{\partial x}{\partial v} + \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial v} \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial v} + \frac{\partial(uv)}{\partial v} \frac{\partial(uv)}{\partial v} = 0 + v^2 + u^2 = u^2 + v^2.$$

Nicht-diagonale Elemente:

Da der metrische Tensor symmetrisch ist, $g'_{ij} = g'_{ji}$, erhält man:

$$g'_{12} = g'_{21} = \frac{\partial x^1}{\partial x'^1} \frac{\partial x_1}{\partial x'^2} = \frac{\partial x}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial x} \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial u} + \frac{\partial(uv)}{\partial x} \frac{\partial(uv)}{\partial u} = 0 + 0 + 0.$$

$$g'_{13} = g'_{31} = \frac{\partial x^1}{\partial x'^1} \frac{\partial x_1}{\partial x'^3} = \frac{\partial x}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial x} \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial v} + \frac{\partial(uv)}{\partial x} \frac{\partial(uv)}{\partial v} = 0 + 0 + 0.$$

$$g'_{23} = g'_{32} = \frac{\partial x^1}{\partial x'^2} \frac{\partial x_1}{\partial x'^3} = \frac{\partial x}{\partial u} \frac{\partial x}{\partial v} + \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial u} \frac{\partial(\frac{1}{2}(u^2 - v^2))}{\partial v} + \frac{\partial(uv)}{\partial u} \frac{\partial(uv)}{\partial v} = 0 - uv + vu = 0.$$

$$\rightarrow g = \begin{pmatrix} 1 & 0 & 0 \\ 0 & u^2 + v^2 & 0 \\ 0 & 0 & u^2 + v^2 \end{pmatrix}.$$

Metrik diagonal \rightarrow Basis orthogonal.

b) Einheitsvektoren:

$\tilde{\mathbf{e}}'_i = \frac{\partial x^j}{\partial x'^i} \mathbf{e}_j$, also

$$\tilde{\mathbf{e}}'_x = \frac{\partial \mathbf{x}}{\partial x} = \frac{\partial}{\partial x} \begin{pmatrix} \frac{1}{2}(u^2 - v^2) \\ uv \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} = \mathbf{e}_x.$$

$$\tilde{\mathbf{e}}'_u = \frac{\partial \mathbf{x}}{\partial u} = \frac{\partial}{\partial u} \begin{pmatrix} \frac{1}{2}(u^2 - v^2) \\ uv \end{pmatrix} = \begin{pmatrix} 0 \\ u \\ v \end{pmatrix}.$$

$$\tilde{\mathbf{e}}'_v = \frac{\partial \mathbf{x}}{\partial v} = \frac{\partial}{\partial v} \begin{pmatrix} \frac{1}{2}(u^2 - v^2) \\ uv \end{pmatrix} = \begin{pmatrix} 0 \\ -v \\ u \end{pmatrix}.$$

Normieren:

$$\mathbf{e}'_x = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}.$$

$$\mathbf{e}'_u = \frac{1}{\sqrt{u^2+v^2}} \begin{pmatrix} 0 \\ u \\ v \end{pmatrix}.$$

$$\mathbf{e}'_v = \frac{1}{\sqrt{u^2+v^2}} \begin{pmatrix} 0 \\ -v \\ u \end{pmatrix}.$$

c) Mit obiger Metrik: $U = 1, V = u^2 + v^2, W = u^2 + v^2$.

Gradient:

$$\begin{aligned} \nabla \phi &= \frac{1}{U} \mathbf{e}'^1 \partial'_1 \phi + \frac{1}{V} \mathbf{e}'^2 \partial'_2 \phi + \frac{1}{W} \mathbf{e}'^3 \partial'_3 \phi \\ &= \frac{1}{U} \mathbf{e}_x \partial_x \phi(x, u, v) + \frac{1}{V} \mathbf{e}_u \partial_u \phi(x, u, v) + \frac{1}{W} \mathbf{e}_v \partial_v \phi(x, u, v) \\ &= \mathbf{e}_x \partial_x \phi(x, u, v) + \frac{1}{\sqrt{u^2+v^2}} \mathbf{e}_u \partial_u \phi(x, u, v) + \frac{1}{\sqrt{u^2+v^2}} \mathbf{e}_v \partial_v \phi(x, u, v). \end{aligned}$$

Divergenz:

$$\begin{aligned} \operatorname{div} \mathbf{a} &= \frac{1}{UVW} [\partial'_1 (VW a'^1) + \partial'_2 (UW a'^2) + \partial'_3 (UV a'^3)] \\ &= \frac{1}{UVW} [\partial_x (VW a_x) + \partial_u (UW a_u) + \partial_v (UV a_v)] \\ &= \frac{1}{u^2+v^2} [\partial_x ((u^2 + v^2) a_x) + \partial_u (\sqrt{u^2 + v^2} a_u) + \partial_v (\sqrt{u^2 + v^2} a_v)] \\ &= \partial_x a_x + \frac{1}{u^2+v^2} \partial_u (\sqrt{u^2 + v^2} a_\theta) + \frac{1}{u^2+v^2} \partial_v (\sqrt{u^2 + v^2} a_v). \end{aligned}$$
