## Black Holes II — Exercise sheet 2

### (12.1) Penrose diagram for Robinson–Bertotti

We derived last semester (see exercise 9.1) the near horizon limit geometry of the extremal Reissner-Nordström black hole, which is known as Robinson–Bertotti geometry. Its line element is given by

$$ds^{2} = -\lambda^{2} dt^{2} + Q^{2} \frac{d\lambda^{2}}{\lambda^{2}} + Q^{2} d\Omega_{S^{2}}^{2}$$

where Q is a constant (the charge) and  $d\Omega_{S^2}^2$  is the line-element of the round  $S^2$ . Show that the singularity at  $\lambda = 0$  is merely a coordinate singularity. Show further that  $\lambda = 0$  is a degenerate Killing horizon with respect to  $\partial_t$ . Finally, obtain the maximal analytic extension of the Robinson–Bertotti metric and deduce its Penrose diagram.

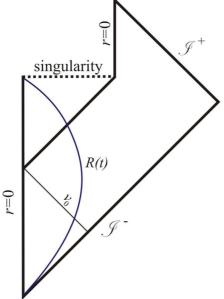

### (12.2) Inventing Penrose diagrams

Draw (2-dimensional) Penrose diagrams for spacetimes with the following properties:

- (a) Asymptotically flat, event horizon, no singularity
- (b) Asymptotically flat, as many Killing horizons as possible, no Cauchy horizon
- (c) Asymptotically flat, no event horizon, singularity
- (d) Asymptotically flat, two non-extremal and one extremal Killing horizon
- (e) Asymptotically flat, at least one Killing horizon, no singularity, no event horizon

# (12.3) Penrose diagram of semi-classically evaporating black hole

What is wrong with the Penrose diagram below?

#### Hints:

- For the first two questions the coordinate transformation  $u = t + Q/\lambda$ ,  $v = t Q/\lambda$  is helpful. For the final task the coordinate transformation  $u = \tan(U/2)$ ,  $v = -\cot(V/2)$  is convenient.
- Follow the algorithm explained during the lectures: start with the asymptotically flat region and "design" an Eddington–Finkelstein patch such that all requirements of the sub-exercise are met. Then, if possible, glue together copies of this Eddington–Finkelstein patch (and/or flipped versions thereof).
- Consider the domain of dependence of various t = const. hypersurfaces. Are there Cauchy hypersurfaces? Is spacetime globally hyperbolic? (Why) should we care about these questions?
